Summit Hosting Boosts Cloud Server Security with 2 Factor Authentication

Cloud hosting services provider to Sage and QuickBooks customers now offering 2 factor authentication to enhance security and prevent cyber attacks.

ATLANTA, GEORGIA – [April 10, 2018] — Summit Hosting, a cloud-based hosting provider focused on Sage and QuickBooks applications, has announced it will now offer customers the option of adding 2 factor authentication to their hosting environment. With cyber attacks and data breaches on the rise, the company is taking added measures to ensure the security and protection of their customer's critical business software systems and data.

2 Factor Authentication (2FA) provides an additional layer of security that can significantly reduce the risk of cyber attacks such as identity theft, phishing emails and ransomware. It consists of an added verification process that requires more than just a password to access your information. This additional step not only notifies you via secondary verification device (like a mobile phone) that your server is being accessed, but enables you to grant or deny that access remotely.

Stan Kania, Summit Hosting CEO, says the decision to enhance security for their hosted customers was a no-brainer. "While new data protection regulations that are rolling out don't specifically require 2 factor authentication, we wanted to go above and beyond to instill even more confidence in our application hosting services. By adding the 2 factor authentication option on top of our existing rock solid technology, we've created what I think is the most secure cloud hosting environment on the market."

Kania adds that while 2 factor authentication creates an extra step in accessing your Sage or QuickBooks system, the process is extremely fast and simple. "When you log into your server, you automatically receive a verification code on your mobile phone. Once you enter the code, you can grant or deny access right from the mobile application. It's a small step that delivers a huge benefit."

2 factor authentication is now available for all hosting users including QuickBooks, all Sage ERP and construction software products, Sage CRM, Sage Fixed Assets and Sage HRMS.
